

didKYC Agentic Micropayment Wallet

Agent-Friendly Wallet Technology

A Bridge Between Human-Controlled Wallets
and **KYC-Enabled Agentic Micropayments.**

AI agents act autonomously under explicit human
and policy boundaries.

The Operational Bridge

Human-controlled funds 🏗️ Machine-executed transactions

⚠️ The Gap: Standalone wallets and traditional KYC cannot meet the needs of autonomous agentic payments.

Human-Controlled Funds

Machine-Executed Transactions

didKYC Identity
Verification

✅ **The Solution:** The operational bridge.

- Identity first: didKYC identity verification.
- Execution second: On-chain transactions.

High-Frequency AI-Agent Micropayments

Low transaction fees. Strong recurring-revenue potential.

The 4 Pillars of Agentic Execution

 Hybrid Custody (Risk Management) Separates higher-value storage from autonomous execution; limits blast radius for agent mistakes or compromise.	 Cold Wallet (Human Control) Preserves clear human ownership over root keys and final authority.	 didKYC (VC-Verifiable Identity) Zero-knowledge-proof identity trust layer enabling machine-verifiable authorisation.	 Micropayment (Agent-to-Agent Economy) Supports frequent, low-value settlement and programmable recurring value exchange.
---	--	---	---

Agent-Wallet-Custodian-Gateway

Structural boundaries for autonomous limits.

Hosted Custody Layer

A permissioned blockchain. Traditional top-ups via bank/credit card.
Max stored value: HK\$3,000.

didKYC Self-Custody Cold Wallet Layer

Non-custodial. User-controlled root key.
Daily transaction cap: HK\$100.

Agent-Friendly Payment Gateway

Features the Agentic Payment Button (WebMCP), a real-time Policy Engine, and machine-readable `payment\_skill.md` instructions.

DID + VC Core

Decentralised, privacy-preserving, zero-knowledge proofs.

👤 eKYC to didKYC:

User completes initial eKYC
→ System issues didKYC
Verifiable Credentials

✨ Selective Disclosure:

AI Agent holds corresponding DID-
DID-based delegated authorisation
for policy-bounded payment
execution

🔒 **Storage:** Cold Wallet stores DID Document references and VC materials required for verification

Verify Identity First, Then Execute

Settlement finality on-chain.

Balancing Compliance and Privacy

Offline + Online Hybrid architecture.

FinTech Side

- **Offline + Online Hybrid:** Cold Wallet supports offline signing, followed by broadcast.
- **Agentic Interface:** Traditional Traditional payment button + dedicated Agentic Payment Button + ``payment_skill.md`` guidance for automated AI-agent execution.

RegTech Side

- **Immutable Audit Trail:** Only necessary hashes/proofs are committed on-chain; sensitive identity evidence is protected in controlled off-chain stores.
- **Transaction Monitoring:** Real-time anomaly detection based on on-chain data and policy telemetry.
